DOMAIN: CONTAINS A HOMO B DOMAIN, ALSO KNOWN AS P OR MIDDLE DOMAIN

AND A SUBTILISIN-LIKE CATALYTIC DOMAIN. ESSENTIAL DOMAINS FOR

CATALYTIC ACTIVITY.

DOMAIN: CONTAINS A CYTOPLASMIC DOMAIN RESPONSIBLE FOR ITS TGN

LOCALIZATION AND RECYCLING FROM THE CELL SURFACE.

DOMAIN: THE PROPEPTIDE IS AUTOCATALYTICALLY REMOVED THROUGH AN

INTRAMOLECULAR CLEAVAGE PROBABLY IN THE ENDOPLASMIC RETICULUM

(ER). IN THE TGN THE SECOND CLEAVAGE IN THE PROPEPTIDE COULD LEAD

TO THE ACTIVATION OF FURIN.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S8; ALSO KNOWN AS THE

SUBTILASE FAMILY. HIGH SIMILARITY WITH OTHER FURIN-LIKE ENZYMES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TRANS GOLGI NETWORK. PROPEPTIDE CLEAVAGE IS A PREREQUISITE FOR EXIT OF FURLN MOLECULES OUT OF THE ENDOPLASHIC RETICULUM (ER). SECOND CLEAVAGE IN THE PROPEPTIDE OCCUR IN THE TRANS GOLGI NETWORK (TGN), WHICH IS FOLLOWED BY THE RELEASE OF THE PROPEPTIDE BOUND TO FURIN AND THE ACTIVATION OF FURIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESPECTIVE PRECURSORS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PROPEPTIDE.

SUBCELLULAR LOCATION: SEEMS TO BE LOCALIZED INTRACELLULARLY TO THE TRANS GOLGI NETWORK. PROPEPTIDE CLEAVAGE IS A PREREQUISITE FOR EXIT OF FURIN MOLECULES OUT OF THE ENDOPLASMIC RETICULUM (ER). SECOND CLEAVAGE IN THE PROPEPTIDE OCCUR IN THE TRANS GOLGI NETWORK (TON), WHICH IS FOLLOWED BY THE RELEASE OF THE PROPEPTIDE BOUND TO FURIN AND THE ACTIVATION OF FURIN.

TISSUE SPECIFICITY: SEEMS TO BE EXPRESSED UBIQUITOUSLY.

DEVELOPMENTAL STAGE: EXPRESSED AT E7 DAY IN ENDODERM AND MESODERM, UNIFORMLY EXPRESSED UNTIL E10, WHEN EXPRESSION IS HIGHER IN HEART OF THE PROPERTY OF THE P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CATALYTIC ACTIVITY.

CONTAINS A CYTOPLASMIC DOMAIN RESPONSIBLE FOR ITS TGN DOMAIN: CONTAINS A CYTOPLASMIC DOMAIN RESPONSIBLE FOR ITS TGN LOCALIZATION AND RECYCLING FROM THE CELL SURFACE.

PTM: THE PROPEPTIDE IS AUTOCATALYTICALLY REMOVED THROUGH AN INTRAMOLECULAR CLEAVAGE PROBABLY IN THE ENDOPLASMIC RETICULUM (ER). IN THE TGN THE SECOND CLEAVAGE IN THE PROPEPTIDE COULD ITO THE ACTIVATION OF FURIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel human conductin protein which has anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to disgnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 11;

Oligonucleotides derived from them are useful for detecting contrations in the Axin gene and for determining whether a subject is contrations in the Axin gene and for determining whether a subject is contractal, carelope cancer (including breast, colorectal, castrointestinal, esophageal, carcinomas or melanomas). The wild compare the provided care also useful for diagnosing cancer and for detecting acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wntt-Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coll (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding mutant and wild type Axin and oligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Axin; cancer; breast cancer; colorectal cancer; gastrointestinal cancer; esophageal cancer; carcinoma; melanoma; diagnosis; treatment; therapy; thyroid carcinoma; tumorigenesis;

                                                           condered arrangement of R groups (defining as side chains), excluding condered arrangement of R groups (defining as side chains), excluding condered arrangement of R groups (tables given in the specification).

(I), and related enzymes, are used to produce a wide range of terpenoids (e.g. cyclic, acylic, optionally hydroxylated), useful e.g. as controlled the result of signal transduction pathways, precursors of signal transduction pathways, precursors of steroid hormones and bile acids, as photoreceptors and as co-factor side chains. Some synthases with little or no catalytic activity (and nucleic acids encoding them) are used as controls in the analysis of products formed by enzymatic synthesis; as nutrient supplements; for affinity purification of isoprenoids; or to develop immunological reagents or nucleic acids for monitoring expression of terpene synthase or nucleic acids for monitoring expression of terpene synthase or nucleic acids for monitoring expression of terpene synthase or nucleic acids for monitoring expression of terpene synthase or nucleic acids for monitoring expression of terpene synthase or nucleic acids for monitoring expression of terpene synthase or nucleic acids for monitoring expression of terpene synthase or nucleic acids for monitoring expression of terpene synthase or nucleic acids for monitoring expression of terpene synthases or nucleic acids for monitoring expression of terpene synthases or nucleic acids for monitoring expression of terpene synthases.

20 may produce novel terpene products. A38910 to A38938 and Y90831 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      18-SEP-1998;

                                                                                                                                        The present sequence is the Pol protein from the simian immunodeficiency virus found in the red capped mangabey and designated SIVrcm. This virus is related to the HIV viruses that cause AIDS in humans. Knowing the sequence of the Pol protein and its gene is useful as it enables screening for the virus to take place in humans and animals (there is a possibility that this virus undergoes cross-species transmission), allows vaccines to be produced and aids research into the origin of these viruses. This latter is important if an AIDS vaccine is to be found.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A neutral protease (W04271) and an alkaline protease (W04270) were identified as being the respective products of the npr gene (T38353) and apr gene (T38352) of Bacillus thuringiensis var. Kurstaki strain EG2371. Proteases have been implicated in the decline of insecticidal activity of crystal proteins in B.t. bioinsecticides. Genetic disablement of the npr and apr genes, by deletion of specific sequences, has allowed the prodn. of by deletion of specific sequences, has allowed the prodn. of B.t. constructs having reduced proteolytic activity and therefore useful for enhanced prodn. of B.t. toxin protein. The B.t. toxins recovered from these B.t. constructs exhibit improved stability with respect to insecticidal activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disabled Bacillus thuringiensis apr and npr genes - encoding neutral and alkaline protease incapable of degrading insecticidal toxic protein (ITP), therefore increasing ITP prodn. and stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 1996-455371/45

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5883081
GENERAL INFORMATION:
APPLICANT: Kraus, Guenter
APPLICANT: Kraus, Guenter
APPLICANT: Repeschia, Eric
APPLICANT: Poeschia, Eric
APPLICANT: Poeschia, Eric
TITLE OF INVENTION: Isolation of No. 5883081el HIV-2 Proviruses
NUMBER OF SEQUENCES: 50
CORRESSONDENCE ADDRESS:
ADDRESSE: Townsend and Townsend and Crew LLP
STREET: Two Embarceadero Center, Eighth Floor
CITY: San Francisco
COUNTRY: USA
ZIP: 94111-3834
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/O8/659,251
FILING DATE: AS-JUL-1995
APPLICATION NUMBER: US/O8/659,251
FILING DATE: MOMBER: US/O8/659,251
FILING DATE: MOMBE

submitted to the EMBL Data Library, May 1998
A; Description: Mig-5, a gene that controls cell fate A; Reference number: Z22326
A; Accession: T43171
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Residues: 1-666 <GUO>
A; Cross references: EMBL:AF063244; PIDN:AAC16434.1
